Executive Summary

Pearson and the Human Resources Research Organization (HumRRO) independently calibrated, scaled, and equated the 2023 Kentucky Summative Assessments (KSA) and produced the raw-score-to-theta-score tables to be applied to students' test results. HumRRO further verified that scoring tables were applied accurately by independently scoring students and comparing scoring results to Pearson's. Results calculated by HumRRO were identical to those calculated by Pearson (L. Hou, email communication, July 6, 2023 [writing]; July 14, 2023 [mathematics, reading, editing and mechanics, science, social studies]). Given that HumRRO's results were identical to those of Pearson, we are assured that Pearson did not commit processing errors.

Third-Party Checking of 2023 Scaling and Equating for the Kentucky Summative Assessments (KSA) Tests

Introduction

Kentucky started administering the Kentucky Summative Assessments (KSA) in spring 2022. The KSA assess student performance on the Kentucky Academic Standards (KAS) using a combination of multiple choice, short answer, and extended response items. Student scores are estimated using a Rasch Item-Response Theory (IRT) model. As new test forms have been developed, an equating process has been implemented to allow for meaningful comparisons over the years with Kentucky's previous assessments.

In spring 2023, the KSA were administered in reading, mathematics, science, social studies, editing and mechanics, and on-demand writing. Reading and mathematics were assessed in grades 3 through 8 and grade 10; science in grades 4, 7, and 11; social studies, editing and mechanics, and on-demand writing in grades 5, 8, and 11.

This report describes how student test responses for the 2023 KSA were used to create scale scores and place students in Novice, Apprentice, Proficient, or Distinguished (NAPD) performance categories. The complex analyses to accomplish these tasks were conducted independently, but cooperatively, by both HumRRO and Pearson staff members. Several interim checks were conducted during the analyses and any discrepancies between the two companies were investigated and ultimately resolved. This process was conducted transparently among Pearson, HumRRO, Kentucky Department of Education (KDE), and Kentucky's psychometric consultant (Dr. Bill Auty of Education Measurement Consulting) via frequent email communications and conference calls. The process was guided by a specifications document created by Pearson¹ and regularly updated based on decisions before and during calibration. This documentation is vital for ensuring consistency of processing across years and for guiding psychometric processing in future years.

Brief Description of 2023 Assessments

In response to the COVID-19 pandemic's impact on schools during the 2020-2021 school year, the United States Department of Education (USED) waived accountability reporting requirements but maintained that states should continue to administer annual summative assessments. This led to a directive from KDE leadership to develop a simple, straightforward assessment focused on comparing current student performance to past student performance.

Beginning with the 2021-2022 academic year, the KSA cover new and revised content standards in reading, mathematics, science, social studies, and writing. For writing, there are two assessment components: 1) editing and mechanics and 2) writing. Except for writing, all tests are a blend of selected response and constructed response items. The writing component is a single essay prompt scored on multiple writing skills (or traits).

Each subject-grade assessment combination in the 2023 KSA consisted of multiple test forms. Each mathematics and reading grade consisted 10 test forms, with number of operational items ranging between 32 and 36 items per form. Science assessments in grades 4, 7, and 11

¹ Kentucky Spring 2023 Psychometric Analysis Specifications v2.1.

consisted of 10 forms, with each form consisting of 24 operational items. Social studies assessments in grades 5, 8, and 11 consisted of 10 forms, with number of operational items ranging between 30 and 35 items per form. Editing and mechanics assessments in grades 5, 8, and 11 consisted of 10 forms, with each form consisting of 26 operational items. Writing assessments in grades 5, 8, and 11 consisted of 4 forms, each with a single essay prompt.

Analysis Procedures

Item parameters were generated (i.e., calibrated) across all grade-level forms for each subject in a single run. This equates test forms for a given grade so that test scores across forms are interchangeable in terms of difficulty. Anchored item calibration and equating analyses were then conducted for all KSA assessments. Finally, raw-score-to-scale (RSS) score tables were generated for all assessments. For each of these analyses, HumRRO followed the analysis specifications provided by Pearson, independently conducted analyses, and verified that our results matched Pearson's results. We summarize HumRRO's processes and procedures for conducting these analyses below.

Sample Identification and File Construction

We first applied exclusion rules to select the sample of student responses to include in the calibration analyses.² Kentucky selects most of its student population for use in the calibration sample for scaling and equating. However, some students are purposefully excluded from the calibration samples, as specified in the 2023 psychometrics specifications document.³ Kentucky's exemption rules generally only apply to students who receive accommodations (e.g., Braille forms, audio, large print, etc.), students with duplicate records (the same identification number and name), and students with blank total test score values. Pearson and HumRRO verified n-counts after this step.

The next step was to format all subject/grade files to be read into the Winsteps IRT psychometric software and create Winsteps⁴ control files to read student responses and estimate item parameters. A sample control file is provided in Appendix A. HumRRO created specialized SAS and R statistical software programs to generate all input and control files automatically. An item documentation file was used to specify item types, location, keys, item use, and other important information. HumRRO and Pearson used the same raw student data files (containing all student responses) but did not share programming or methodology for creating the input, control, or data files for Winsteps. HumRRO followed the guidance provided by Pearson (with input from KDE) regarding the treatment of blank responses, condition codes, etc. in creating the input data files.

Calibration and Scaling Procedures

Once input and control files were prepared, Winsteps software was used to calibrate test items across grade-level test forms. Multiple-choice items were fit to the Rasch measurement model and constructed-response items (short constructed response and extended response items) were fit to the Partial Credit Model (PCM). Both types of items were simultaneously calibrated in Winsteps and item difficulty parameters (logits) were produced. "Step parameters" were also produced for constructed response items. Step parameters for an item indicate how the various points possible on the item relate to the item's overall difficulty and are important for generating

² Students who are excluded from calibration analyses are not excluded from scoring and reporting.

³ Kentucky Spring 2023 Psychometric Analysis Specifications v2.1.

⁴ HumRRO used Winsteps version 4.8.0.0 for this project.

scoring tables. These parameters are produced on the theta scale (a commonly used scale with a mean of 0 and a standard deviation of 1). Appendix B contains an example of item parameters for one grade subject (logits and step parameters). Pearson and HumRRO verified item parameter estimates after this step.

Equating Procedures

HumRRO conducted two types of equating for the KSA: (a) forms equating within a given test administration year and (b) equating across test administration years using common anchor items. Forms equating is accomplished by calibrating all items for a given subject-grade combination together. Calibrating all the items together (i.e., across all forms) effectively equates the various forms for a given subject-grade combination such that test scores across forms are interchangeable in terms of difficulty. Form equating was necessary for all subject-grade tests.

For each assessment, we also equated the current year's scores to scores from prior years. To accomplish this, we first examined the stability of the linking items to ensure that item difficulty had not shifted excessively between administrations. We conducted the Robust Z (Huynh & Meyer, 2010; Huyn & Rawls, 2009) statistical procedure to determine whether any linking items should be dropped from the equating process. Items with a substantial difference in item difficulty, as defined in the test specifications document, were not included as anchor items in equating. The resulting set of anchor items was then used to create the raw-score-to-scale-score tables.

Raw-score-to-Scale-Score Procedures

The item parameter estimates from the equating analyses for reading, mathematics, science, social studies, editing and mechanics and on-demand writing were used in Winsteps to generate person ability estimates by form and by reporting categories. Ability estimates were reported in raw-score-to-theta-score tables.

Once theta scoring tables were obtained, they were linearly transformed to a reporting scale of 400-600 for all grade subjects. Performance levels (Novice, Apprentice, Proficient, and Distinguished; NAPD) were also assigned to each score. Scale score cuts were used, as opposed to theta cuts, to assign performance levels to students' scale scores. Using these cuts allowed scale scores associated with each performance level to be fixed across test administrations.

Verification of 2023 Scoring Tables

After verification of the raw-score-to-scale score tables, scoring tables were generated to assign student performance level classifications. HumRRO checked the 2023 scoring tables and verified that the correct scale score ranges were associated with each performance level. HumRRO matched Pearson on all subjects and grades.

Field Test Item Calibration

After operational items were placed onto the base scale, field test items were placed onto the same scale through anchored item calibration linked by the operational items. Field test items with negative point-biserial correlations were excluded from the calibration. Two Editing and Mechanics items were excluded from the calibration because they contained typing errors. HumRRO matched Pearson on all subjects and grades.

Documentation

As HumRRO and Pearson completed each step of the process described above, Winsteps item parameter, anchor item, and score, and output files were shared to check for inconsistencies. Winsteps output files included the number of cases in the calibration sample, item-level information (e.g., p-values, parameters), and the theta scoring tables. A sample of the input and output files are appended to this document. They include:

1. Winsteps Control Files (Appendix A). These files contain the item parameter estimation specifications and important information for reading the student score files. It also specifies the output file names. The appendix includes an example control file for the initial item parameter estimation, equated item parameter estimation, and estimation of the cluster scores.
2. Winstep Item Parameter Files (Appendix B). These files contain the item parameters for the operational items. Each multiple-choice item has one parameter, a logit difficulty (named Measure in the Winstep files). Each constructed-response item has an overall difficulty parameter and a number of step parameters indicating how the points for the item are distributed along the theta scale. The file included in the appendix is an example of a final item parameter file. Initial item parameter files are in similar formats.
3. Winsteps Anchor File (Appendix C). The file includes the 2023 item parameter values for each anchor item with the equating shift estimate applied to the overall difficulty measure. The file is read by Winsteps and used to fix the item parameter values and estimate final score files.
4. Winsteps Score File (Appendix D). The file contains the raw score to theta estimation and includes the distribution of student scores.
5. Comparison of Files Output (Appendix E). This is a spreadsheet file from HumRRO's comparison program that checks scoring table results against Pearson's results. The files match if all comparison values are 0.

Conclusion

Pearson and HumRRO independently calculated the scaled/equated raw-score-to-scale-score tables for 2023 KSA reading and math (grades 3–8, 10), social studies and writing (grades 5, 8, 11), and science (grades 4, 7, 10). No differences were found between Pearson's and HumRRO's parameter estimations or raw-score-to-scale-score tables. Given that HumRRO's and Pearson's scaling and equating results were identical, HumRRO is confident that Pearson did not commit processing errors.
