

# **APPENDIX B**

**2014-2015 ANNUAL SCHOOL IMMUNIZATION SURVEY—  
County Profiles about Immunization Coverage**

## Appendix B: County Profiles about Immunization Coverage

Each county's profile summarizes school survey responses and how each age group collectively compares to the state average, US average, and the Healthy People 2020 Objectives. These pages are meant to provide a quick snapshot of school-aged immunization coverage rates and to identify areas for improvement as assessed from the Annual School Immunization Survey.

### How to read a county profile

**No. of Children:** These numbers indicate how many total children were counted in the survey responses for each specific age group. This is not a count of how many schools or childcare facilities reported last year. Use caution when reviewing data when these numbers are very low.

**Percentage of Certificates and Exemptions on File:** This table provides a quick and easy way to determine the percentage breakdown of certificate type by age group. The majority of all certificates are current, including provisional and expired; however, if the exemptions or no certificates on file appears larger than those in another county, perhaps this is something to educate providers, schools, or parents about in order to address the potential risk for vaccine preventable diseases.

**Vaccination Coverage Levels (with 95% Confidence Intervals) for Kindergarten and Sixth Grade:** Each bar chart displays the calculated mean for each age-specific vaccination by age group. The black line with a vertical bracket at the beginning and end of the line identifies a 95% confidence interval for the lower and upper limit of the mean for each age-specific vaccination. This confidence interval represents a level of certainty about how good the calculated mean estimates the true mean if the school survey was repeated again and again. Ninety-five percent confidence intervals are routinely calculated by epidemiologists and statisticians, so you can be 95% certain the calculated confidence interval contains the true mean of the population. Sample size can change the width of the calculated confidence interval. Small counties with few schools and a small number of reports for students in each age group will cause the calculated range of values for the confidence interval to be much larger than counties with more schools and a larger number of reports for students. The confidence interval is much narrower when calculated with the survey data from a larger number of students.

**Age-Specific Group Vaccines and Doses:** This section of the page outlines the percentage of children in each age group with the appropriate number of age-specific vaccine doses.

**County Ranking:** Counties were ranked 1 (Best) to 120 (Least) for the average percentage of children with the appropriate age-specific vaccine doses.

**KY Average:** Overall state average percentages of age-specific vaccine doses.

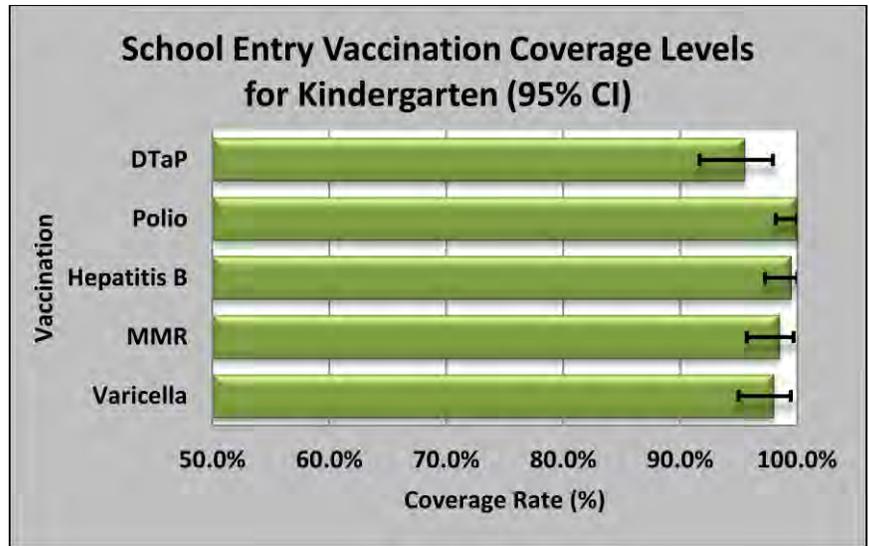

**US Average:** Overall US average percentages of age-specific vaccine doses.

**HP 2020 Goal:** Targets for Healthy People (HP) 2020 Objectives vary between age groups. This percentage increases for Kindergarten to 95% for all age-specific vaccines. The objectives for Sixth Grade cover newer immunization requirements for Tdap, MCV and the second Varicella dose. If any county percentages did not meet the HP 2020 Goal for an age-specific vaccine during the 2014-2015 school year, those percentages will be highlighted in red with the words "Not Met" for that vaccine indicated in the corresponding row of the profile table.
